

Decarbonization Explorer

Visual Style Guide

The shared visual language for the climate policy simulator — colors, typography, and component rules. Use it for every new screen, chart, and country deployment.

1 • Color palette

A warm paper base with an editorial ink. Two semantic data colors carry all meaning in charts: red for rising/BAU, green for falling/action. The gold accent is Uganda's — it swaps per country.

COUNTRY ACCENT (SWAPPABLE)

Uganda gold

#E3B505

Rule: one accent per country, drawn from its flag, used only for highlights — annotation markers, active-section underlines, small flag chip. It never carries data meaning (red/green do that), so swapping countries never changes how charts read. Keep chroma and lightness close to the gold: e.g. `oklch(0.75 0.14 hue)`.

2 · Typography

Three families, three jobs. Never introduce a fourth.

Aa

Newsreader — display serif

Headlines, findings, big numbers. Weights 600–700. App title 20px · section headline 23–24px · card headline 19px · stat figures 21–26px.

font-family: 'Newsreader', serif

Aa

Libre Franklin — workhorse sans

Everything else: body 14px / 1.6 · chat 13.5px / 1.5–1.6 · nav 13.5px · buttons and chips 12.5–13px · small labels 11.5–12px, weight 600, letter-spacing 0.08em, UPPERCASE.

font-family: 'Libre Franklin', sans-serif

Aa

IBM Plex Mono — model voice

Anything that belongs to the model, not the prose: variable names (`energy_demand_pc`), run metadata, chart axis labels (10–12px), slider readouts. It signals "this is the machine, verbatim".

font-family: 'IBM Plex Mono', monospace

SCALE IN USE

BRIEFING 01 · BAU — mono label, 11–12px

Without policy action, emissions nearly triple — headline, serif

23px/700

Net emissions climb from **112 Mt CO₂e** to **278 Mt by 2070**, driven by population growth and rising energy demand. — body, sans 14px/1.6

278 Mt CO₂e in 2070 — stat pair: serif figure + sans caption

3 · Component rules

HEADER

Serif wordmark + country selector chip (flag stripes 22×15px, 2px radius) + right-aligned sans nav. Bottom border: **3px solid ink** — the signature editorial rule. Active nav item: 600 weight + 2px crane-red underline.

CHAT

User: ink bubble, radius 12/12/3/12, paper text. Model: **no bubble** — plain body text on parchment; bold for figures. Suggested actions: white pill chips, 20px radius. Send: 38px crane-red circle.

What if the peak slips?

CARDS & SURFACES

White cards on paper, 1px hairline border, **8px radius** (10px for outer frames, 6px for small elements). No drop shadows inside the app. Highlighted/selected state: parchment fill + 1.5px crane-red border.

CHARTS

Line weight 2.5–3.5px. **BAU/reference = dashed** (6 4), scenarios = solid. Endpoint dot + mono label. Gridlines: hairline #F2EADD, baseline #E5D9C8. Axis labels mono 10–12px. Annotation hotspots: 13px numbered circles — red for the key moment, gold second, tan third.

VOICE

Headlines state the finding, not the task: *"A clean grid by 2040 avoids 41 Mt per year"* — never *"Simulation results"*. Every number a policymaker sees gets a plain-language driver behind it; every model variable shown is written verbatim in mono. Red/green always mean rising/falling — never country, party, or brand.

4 • Data visualization

Rules for translating the team's Tableau charts (scenario small multiples, sector stacked areas, cost–benefit bars) into the house style. The structure stays — panels per scenario, milestone years, direct labels — only the skin changes.

Forest sink (below 0)

#3E6B47

Net total line

#262421 · 2.5–3px

Areas render at **85% opacity** with a 1px solid edge of the same hex — that's what gives Tableau areas their crisp outline. Max ~8 bands per chart; group the rest into "Other". Stack largest at the bottom. Need more than 8 (e.g. crop types)? Use tints of these same hues, never new hues.

SCENARIO SMALL MULTIPLES

Keep the Tableau structure: one panel per scenario, **shared y-axis** drawn once on the left, panels separated by hairlines with the scenario name in sans 13px/600 above each. Milestone years (2035, 2050) get a **dashed vertical rule** (#C9BBA4, dash 4 4) in every panel, with the net-total value at the intersection in mono 11px — those printed numbers are what lets panels be compared without hovering. Label bands directly inside the area when the band is tall enough (sans 12px, ink at 70%); use a right-side legend only for overflow series.

HOVER TOOLTIP — ANATOMY

Crosshair: 1px dashed ink rule snapped to the nearest year, dot on every series (4.5px, 1.5px white ring).

Card: white, 1px #D9CCB8 border, 6px radius, shadow 0 4px 16px rgba(38,36,33,0.14). Header row in mono 11px: year · scenario. One row per series: 9px color chip, sans 12px label, **mono right-aligned value** so digits align. Hovered series bold, listed first. Max 6 rows + "...3 more".

Never rely on hover alone — milestone values are always printed on the chart, so it reads on paper and in PDF exports.

COST-BENEFIT BARS

Stacked columns around a zero line: benefits stack upward in **gold-to-amber tints** (#E3B505 → #E0A458 → #C96A5C for co-benefit categories), costs downward in **slate #7A93AC**. Net benefit is the ink line with endpoint dots across scenarios. Zero line: 1px dashed #C9BBA4. Scenario names below in sans 12px, horizontal — never rotated 90° like Tableau's defaults.
